

# The Kenton Brothers Cannabis Security Solution

**Seed to Sale Asset/Ingredient Tracking** Track plants and other ingredients in real-time from seed to sale with RFID tags and technology, which have inherent reporting and compliance processes.

RFID technology helps meet the standards of data driven regulatory models (like Colorado's Metrc system), which allow for quick evaluation of the current market, holding suppliers accountable and streamlining enforcement. Employ RFID tracking to ensure regulatory compliance for ingredient tracking in edibles and end-user products.

**Vaults** Protect product with a high street sale value by storing it in state-of-the-art vaults. When a dispensary operates on a cash basis, a safe or dual-authentication vault system is essential for safely keeping money on the premises.

**Point-of-Sale Integration** Integrate point-of-sale (POS) software with RFID technology to easily and accurately track inventory.

**Credential Capture** Scan IDs to verify age and optionally use captured data for marketing initiatives.

**Digital Records Storage and Backup** Securely store digital records and backup to the cloud in real time.

**IP Video Surveillance** Take advantage of your current network by connecting IP video surveillance to it. Strategic installation offers a clear view of people and dispensary or cultivation facilities. Surveillance signage can deter criminal acts. Images captured in high definition can be used to identify individuals and as evidence.

**Unified Access Control** Assign levels of facility and area access based on a person's role or function with an access control system. Paired with video surveillance, it allows for active dispensary or cultivation facility monitoring and recording suspicious activity. Integrating access control and video provides centralized control for easy administration and management. Card credential, key fob, smart phone app and biometric control systems are options available to match your operation.

**Visitor Management** Digitally log the comings and goings of visitors to your facility to conquer the challenges associated with maintaining privacy, safety and regulatory compliance.

**Perimeter Fencing** Enclose cultivation facilities with industrial-grade, protective fencing to gain privacy and protection, as well as help secure immediate surroundings. Non-lethal electric fencing is available. Restrict access to parking lots with parking gates used during on and/or off hour times.

**Intrusion Detection Systems** Receive recommendations for the newest options in defense devices, which are carefully evaluated based your dispensary or cultivation facility's needs and layout.
